

Ancient Monuments Laboratory
Report 92/97

A LIST OF VERTEBRATE SKELETONS
IN THE REFERENCE COLLECTION OF
THE ANCIENT MONUMENTS
LABORATORY, LONDON

E Corke
S J M Davis
S Payne

AML reports are interim reports which make available the results of specialist investigations in advance of full publication. They are not subject to external refereeing and their conclusions may sometimes have to be modified in the light of archaeological information that was not available at the time of the investigation. Readers are therefore asked to consult the author before citing the report in any publication and to consult the final excavation report when available.

Opinions expressed in AML reports are those of the author and are not necessarily those of the Historic Buildings and Monuments Commission for England.

Ancient Monuments Laboratory Report 92/97

A LIST OF VERTEBRATE SKELETONS IN
THE REFERENCE COLLECTION OF THE
ANCIENT MONUMENTS LABORATORY,
LONDON

E Corke
S J M Davis
S Payne

Summary

This report lists the current holdings of vertebrate skeletons in the Ancient Monuments Laboratory, updating the list published three years ago (Corke, Davis and Payne, 1994). A total of 1895 specimens, of which 1528 are complete skeletons, includes 70 species of mammal , 169 species of bird, 4 species of reptile, 2 species of amphibian and 47 species of fish.

Introduction

The purposes of the reference collection of vertebrate skeletons in the Ancient Monuments Laboratory are a) to enable the identification and interpretation of animal remains from archaeological sites in England, and b) to provide comparative material for a long-term study of the development of the "traditional" British farmyard animals. Most specimens are from the British Isles, although a small number come from other parts of the Palaearctic.

This list, an updated version of Corke, Davis and Payne (1994), aims to provide a general and rapid guide to our holdings. It is intended for zoo-archaeologists and workers in other disciplines who may wish to consult our collection.

Collection policy

We continue to enlarge the collection and are very willing to exchange specimens - our list shows which taxa we lack and those which are well-represented. We have also started to commission high quality casts of skeletons of rare species of birds from the Natural History Museum, Paris. Duplicates of these casts may be available for exchange or purchase.

The collection

All specimens in the collection are disarticulated. Most have been prepared by incubation in a solution of proteolytic enzyme (see Davis and Payne, 1992). The bulk of the collection is on open access in room 528 of the Ancient Monuments Laboratory. The table below gives an approximate breakdown of the numbers of specimens per species. Thus 28 species of mammals in our collection are represented by 10 or more specimens, whereas 89 species of bird and 29 species of fish are represented by 1 or 2 specimens only. A more detailed catalogue (held in the AM Lab) provides additional information, when available, for each specimen, including precise locality from which it came, criteria used to identify it, how and when it died, method of preparation, donor, and flock/field/ring number.

No. of specimens per species:

	1	2	3	4	5	6-9	10-20	>20	N _{ind}	N _{spp}
Mammals:	14	7	4	4	3	10	18	10	1109	70
Birds:	57	32	15	10	18	23	12	2	651	169
Reptiles:	4	-	-	-	-	-	-	-	4	4
Amphibia:	1	-	-	-	1	-	-	-	6	2
Fish:	20	9	7	6	1	3	1	-	125	47
total									1895	292

Key: N_{ind} = the number of individual specimens, N_{spp} = the number of species

The list

Eight categories of information are included under the following headings:

Family/Genus species. Taxonomy and order follow Corbet and Hill (1986) for mammals, Peterson et al. (1983) for birds, and Wheeler (1978) for fish.

English name.

Sex where known.

Age when known. Some of the laboratory and farm animals are aged to the nearest day or week. For fish the total length *TL*, in cms, is given when available. This is the distance between tip of snout and posterior edge of the caudal fin (see Wheeler and Jones, 1989 fig 13.1).

Comp. This column indicates approximately how complete the specimen is. Thus 1 = most or all bones and teeth are present, 2 = partial skeleton (includes the skull and a mandible, limb girdles, and one fore and one hind limb), 3 = skull and mandibles only, 4 = very incomplete, 5 = other. "c" refers to casts.

Breed; Locality. In this column breed, where known, is given for domestic animals, as is zoo-bred or laboratory-bred origin for wild species. County, and island where relevant, are given for specimens from Britain, and country for specimens from overseas; greater detail is usually available.

AML no. is the accession number.
