AM No	X-Ray No	Photo No	Description and Report	Ref No
747113			<p>A sample of iron-replaced wood was submitted for identification. Examination in reflected light did not produce any useful observations. Fragments were therefore examined in the scanning electron microscope. The wood seemed to be ring porous with some uniseriate rays and rays up to five cells wide. This most closely resembles ash (<u>Fraxinus</u> sp.), although it could be elm (<u>Ulmus</u> sp.).</p> <p>(No micrographs taken).</p> <p>Carole A Keepax</p>
